Recap of data format for ML algorithms

For any ML algorithm,

- Data must be in tabular form
- Training features must be numerical

Bag of words model

- Extract word tokens
- Compute frequency of word tokens
- Construct a word vector out of these frequencies and vocabulary of corpus

Bag of words model example

Corpus

```
"The lion is the king of the jungle"

"Lions have lifespans of a decade"

"The lion is an endangered species"
```

Bag of words model example

```
Vocabulary \rightarrow a , an , decade , endangered , have , is , jungle , king , lifespans , lion , Lions , of , species , the , The
```

"The lion is the king of the jungle"

```
[0, 0, 0, 0, 0, 1, 1, 1, 0, 1, 0, 1, 0, 2, 1]
```

"Lions have lifespans of a decade"

"The lion is an endangered species"

Text preprocessing

- Lions , lion → lion
- The, the \rightarrow the
- No punctuations
- No stopwords
- Leads to smaller vocabularies
- Reducing number of dimensions helps improve performance

Bag of words model using sklearn

```
corpus = pd.Series([
    'The lion is the king of the jungle',
    'Lions have lifespans of a decade',
    'The lion is an endangered species'
])
```

Bag of words model using sklearn

```
# Import CountVectorizer
from sklearn.feature_extraction.text import CountVectorizer
# Create CountVectorizer object
vectorizer = CountVectorizer()
# Generate matrix of word vectors
bow_matrix = vectorizer.fit_transform(corpus)
print(bow_matrix.toarray())
```

```
array([[0, 0, 0, 0, 1, 1, 1, 0, 1, 0, 1, 0, 1], 0, 3],
[0, 1, 0, 1, 0, 0, 1, 0, 1, 0, 1, 1, 0, 0],
[1, 0, 1, 0, 1, 0, 0, 1, 0, 1, 0, 1, 0],
[1, 0, 1, 0, 1, 0, 0, 0, 1, 0, 1, 1]], dtype=int64)
```

Spam filtering

message	label
WINNER!! As a valued network customer you have been selected to receive a \$900 prize reward! To claim call 09061701461	spam
Ah, work. I vaguely remember that. What does it feel like?	ham

Steps

- 1. Text preprocessing
- 2. Building a bag-of-words model (or representation)
- 3. Machine learning

Text preprocessing using CountVectorizer

CountVectorizer arguments

lowercase: False, True
strip_accents: 'unciode', 'ascii', None
stop_words: 'english', list, None
token_pattern: regex
tokenizer: function

Building the BoW model

```
# Import CountVectorizer
from sklearn.feature_extraction.text import CountVectorizer
# Create CountVectorizer object
vectorizer = CountVectorizer(strip_accents='ascii', stop_words='english', lowercase=False)
# Import train_test_split
from sklearn.model_selection import train_test_split
# Split into training and test sets
X_train, X_test, y_train, y_test = train_test_split(df['message'], df['label'], test_size=0.25)
```

Building the BoW model

```
...
# Generate training Bow vectors
X_train_bow = vectorizer.fit_transform(X_train)

# Generate test BoW vectors
X_test_bow = vectorizer.transform(X_test)
```

Training the Naive Bayes classifier

```
# Import MultinomialNB
from sklearn.naive_bayes import MultinomialNB
# Create MultinomialNB object
clf = MultinomialNB()
# Train clf
clf.fit(X_train_bow, y_train)
# Compute accuracy on test set
accuracy = clf.score(X_test_bow, y_test)
print(accuracy)
```

0.760051

FEATURE ENGINEERING FOR NLP IN PYTHON

Building n-gram models

FEATURE ENGINEERING FOR NLP IN PYTHON

Data Scientist

BoW shortcomings

review	label
'The movie was good and not boring'	positive
'The movie was not good and boring'	negative

- Exactly the same BoW representation!
- Context of the words is lost.
- Sentiment dependent on the position of 'not'.

n-grams

- Contiguous sequence of n elements (or words) in a given document.
- $n = 1 \rightarrow bag-of-words$

```
'for you a thousand times over'
```

• n = 2, n-grams:

```
[
'for you',
'you a',
'a thousand',
'thousand times',
'times over'
]
```

n-grams

```
'for you a thousand times over'
```

• n = 3, n-grams:

```
[
'for you a',
'you a thousand',
'a thousand times',
'thousand times over'
]
```

Captures more context.

Applications

- Sentence completion
- Spelling correction
- Machine translation correction

Building n-gram models using scikit-learn

Generates only bigrams.

```
bigrams = CountVectorizer(ngram_range=(2,2))
```

Generates unigrams, bigrams and trigrams.

```
ngrams = CountVectorizer(ngram_range=(1,3))
```

Shortcomings

- Curse of dimensionality
- Higher order n-grams are rare
- Keep n small

Let's practice!
